

Ruby Backend Test

We would like to code a CLI in ruby to know the weather of the cities of Barcelona using the 'eltiempo.com' api.

This is the api url for the cities of Barcelona:

`http://api.tiempo.com/index.php?api_lang=es&division=102`

To get access to the api you can use our identification, with the param "affiliate_id".

Our id is **`zdo2c683olan`**

We just want to know the average of the minimum and maximum temperature during the week, and the temperature of the day.

We could run it like this:

```
eltiempo -today 'Gavá'  
eltiempo -av_max 'Gavá'  
eltiempo -av_min 'Gavá'
```

Good luck!
